# Review of Numbers

Counting and  
Computing

Keith Fligg

- $\mathbb{N}$  – Natural Numbers

The natural numbers are either  $\{0, 1, 2, \dots\}$  or  $\{1, 2, \dots\}$ , depending on who you are talking to. The natural numbers are infinite but denumerable (countable).

# Review of Numbers

- $\mathbb{N}$  – Natural Numbers  
The natural numbers are either  $\{0, 1, 2, \dots\}$  or  $\{1, 2, \dots\}$ , depending on who you are talking to. The natural numbers are infinite but denumerable (countable).
- $\mathbb{Z}$  – Integers  
The integers are  $\{\dots, -2, -1, 0, 1, 2, \dots\}$  and are also infinite and countable.

# Review of Numbers

- $\mathbb{N}$  – Natural Numbers  
The natural numbers are either  $\{0, 1, 2, \dots\}$  or  $\{1, 2, \dots\}$ , depending on who you are talking to. The natural numbers are infinite but denumerable (countable).
- $\mathbb{Z}$  – Integers  
The integers are  $\{\dots, -2, -1, 0, 1, 2, \dots\}$  and are also infinite and countable.
- $\mathbb{R}$  – Real Numbers  
The reals are all infinite decimal representations of numbers on the interval  $(-\infty, +\infty)$ . They are infinite and uncountable.

# Numerical Representation in the Brain

Counting and  
Computing

Keith Fligg

- Humans and other animals share non-verbal representations of numerical quantities.

# Numerical Representation in the Brain

Counting and  
Computing

Keith Fligg

- Humans and other animals share non-verbal representations of numerical quantities.
- These magnitudes suffer from scalar variability (noise).

# Numerical Representation in the Brain

Counting and  
Computing

Keith Fligg

- Humans and other animals share non-verbal representations of numerical quantities.
- These magnitudes suffer from scalar variability (noise).
- They also obey Weber's law:  $\Delta I/I = k$

# Numerical Representation in the Brain

Counting and  
Computing

Keith Fligg

- Humans and other animals share non-verbal representations of numerical quantities.
- These magnitudes suffer from scalar variability (noise).
- They also obey Weber's law:  $\Delta I / I = k$
- Countable ( $\mathbb{N}$ ) and uncountable ( $\mathbb{R}$ ) quantities are likely both stored as magnitudes.

# Numerical Representation in the Brain

Counting and  
Computing

Keith Fligg

- Humans and other animals share non-verbal representations of numerical quantities.
- These magnitudes suffer from scalar variability (noise).
- They also obey Weber's law:  $\Delta I / I = k$
- Countable ( $\mathbb{N}$ ) and uncountable ( $\mathbb{R}$ ) quantities are likely both stored as magnitudes.
- Numerosity and duration are represented by the same magnitudes

# Counting and Ordering

Counting and  
Computing

Keith Fligg

- Subitizing is a non counting process for recognizing numbers smaller than five.

# Counting and Ordering

Counting and  
Computing

Keith Fligg

- Subitizing is a non counting process for recognizing numbers smaller than five.
- Non-verbal counting process is likely shared between humans and other animals.

# Counting and Ordering

Counting and  
Computing

Keith Fligg

- Subitizing is a non counting process for recognizing numbers smaller than five.
- Non-verbal counting process is likely shared between humans and other animals.
- We increment a counter that is represented by a magnitude and compare it to our stored target.

# Counting and Ordering

- Subitizing is a non counting process for recognizing numbers smaller than five.
- Non-verbal counting process is likely shared between humans and other animals.
- We increment a counter that is represented by a magnitude and compare it to our stored target.
- Ordering of numbers is mediated by the magnitude representation in the brain.

# Counting and Ordering

- Subitizing is a non counting process for recognizing numbers smaller than five.
- Non-verbal counting process is likely shared between humans and other animals.
- We increment a counter that is represented by a magnitude and compare it to our stored target.
- Ordering of numbers is mediated by the magnitude representation in the brain.
- Large, close numbers take longer to order.

# Counting and Ordering

- Subitizing is a non counting process for recognizing numbers smaller than five.
- Non-verbal counting process is likely shared between humans and other animals.
- We increment a counter that is represented by a magnitude and compare it to our stored target.
- Ordering of numbers is mediated by the magnitude representation in the brain.
- Large, close numbers take longer to order.
- **Abstract representations can be ordered.**

# Binary Operations

Counting and  
Computing

Keith Fligg

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.
- Chimpanzees were able to select the numeral that was the sum of two different, spatially separated numerals.

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.
- Chimpanzees were able to select the numeral that was the sum of two different, spatially separated numerals.

- Subtraction

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.
- Chimpanzees were able to select the numeral that was the sum of two different, spatially separated numerals.

- Subtraction

- Rhesus macaques and the disappearing object.

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.
- Chimpanzees were able to select the numeral that was the sum of two different, spatially separated numerals.

- Subtraction

- Rhesus macaques and the disappearing object.
- 'time-left' paradigm.

# Binary Operations

Binary operations appear to be manipulations of internal magnitude representations.

- Addition

- Rhesus macaques were able to select arrays of Arabic numerals with the greatest sum.
- Chimpanzees were able to select the numeral that was the sum of two different, spatially separated numerals.

- Subtraction

- Rhesus macaques and the disappearing object.
- 'time-left' paradigm.

- Multiplication and Division

# Binary Operations

- Multiplication and Division
  - Weber's law?
  - Arithmetic inference from behavioral effects.
  - **Division??**

# Alan Turing (1912-1954): Mathematician

Counting and  
Computing

Keith Fligg

## ■ Turing Machine

# Alan Turing (1912-1954): Mathematician

Counting and  
Computing

Keith Fligg

- Turing Machine
- Turing Test

# Alan Turing (1912-1954): Mathematician

Counting and  
Computing

Keith Fligg

- Turing Machine

- Turing Test

**Me:** Dylan, you're going to run into something.  
Why are you wearing that hat over your face?

**Dylan:** I'm a grinder soldier.

**Me:** What does a grinder soldier do?

**Dylan:** That means I eat crime.

**Me:** You eat crime? What does crime taste like?

**Dylan:** Oranges.

- Ken Jennings

# What is Computing?

Counting and  
Computing

Keith Fligg

This is a good question with conflicting answers.

# What is Computing?

This is a good question with conflicting answers.

- Performing arithmetic operations and reporting on and/or carrying out a prescribed action in relation to them. Does not include counting.

([www.oalj.dol.gov/public/dot/refrnc/dotappb.htm](http://www.oalj.dol.gov/public/dot/refrnc/dotappb.htm))

# What is Computing?

This is a good question with conflicting answers.

- Performing arithmetic operations and reporting on and/or carrying out a prescribed action in relation to them. Does not include counting.

([www.oalj.dol.gov/public/dot/refrnc/dotappb.htm](http://www.oalj.dol.gov/public/dot/refrnc/dotappb.htm))

- Originally, the word computing was synonymous with counting and calculating, and a computer was a person who computes. Since the advent of the electronic computer, it has come to also mean the operation and usage of these machines, the electrical processes carried out within the computer hardware itself.

([en.wikipedia.org/wiki/Computing](http://en.wikipedia.org/wiki/Computing))

([en.wikipedia.org/wiki/Computing](http://en.wikipedia.org/wiki/Computing))

- Evaluation of algorithms.

# What is an Algorithm?

- In 1900, mathematician David Hilbert addressed the International Congress of Mathematicians in Paris and presented 10 (out from 23) unsolved problems. The tenth was to devise a test to determine if a polynomial has an integral root.

# What is an Algorithm?

- In 1900, mathematician David Hilbert addressed the International Congress of Mathematicians in Paris and presented 10 (out from 23) unsolved problems. The tenth was to devise a test to determine if a polynomial has an integral root.
- Church-Turing thesis (1936):  $\lambda$ -calculus and Turing machines.

# What is an Algorithm?

- **Examples: FOIL, TSP, others?**

# What Problems are Computable (solvable)?

Counting and  
Computing

Keith Fligg

- Not very many – with a very abstract definition of problem.

# What Problems are Computable (solvable)?

- Not very many – with a very abstract definition of problem.
- In fact there are infinitely more unsolvable problems than there are solvable ones.

# What Problems are Computable (solvable)?

- Not very many – with a very abstract definition of problem.
- In fact there are infinitely more unsolvable problems than there are solvable ones.
- In 1970 Yuri Matijasevič proved that there is no algorithm to determine if a polynomial has integral roots.

# What Problems are Computable (solvable)?

- Not very many – with a very abstract definition of problem.
- In fact there are infinitely more unsolvable problems than there are solvable ones.
- In 1970 Yuri Matijasevič proved that there is no algorithm to determine if a polynomial has integral roots.
- So, how do animals without computers solve problems (compute algorithms)? And how do they manage to solve all of their problems when we know that many of their problems can't be computed?
